Calculating the Energy Released by Fuels

## Formula Mass

Formula mass is the total mass of all the different parts of a chemical formula.

- Use the relative atomic masses listed in your data book
- Use the 'Ls' !

## Example

Calculate the formula mass of $\mathrm{MgCl}_{2}$

Tip - remember that formula mass has no units.
Calculate the formula mass of each of the following:
a) NaOH
b) $\mathrm{H}_{2} \mathrm{O}$
c) $\mathrm{AlBr}_{3}$
d) Calcium sulphide
e) Magnesium sulphate
f) Lithium phosphide
g) Potassium phosphate
h) Dinitrogen trioxide

Tip - remember to use the valency swap over rule when writing chemical formulae. Don't forget that you don't use this rule when dealing with prefixes like di and tri.

## Gram Formula Mass - The Mole

The mass of one mole of a substance is equal to the gram formula mass of that substance (the formula mass in grams).

To calculate the mass of 1 mole of a substance first calculate the formula mass then add the unit ' $g$ ' for grams.

Example
Calculate the mass of 1 mole of aluminium oxide.

First you need the correct chemical formula - use the valency swap over rule:

Now calculate the gram formula mass:

|  | AI | O |
| :---: | :---: | :---: |
| Valency Swap |  |  |
|  |  |  |
|  | 2 | 3 |
| Formula | $\mathrm{Al}_{2} \mathrm{O}_{3}$ |  |

Calculate the mass of 1 mole of each of the following:
a) Magnesium hydroxide
b) Potassium permanganate
c) Ammonium nitrate
d) Aluminium phoshate
e) Calcium nitride
f) Boron tribromide
g) Phosphorus pentachloride
h) Iron (III) sulphide
i) Copper (I) bromide
j) Lead (II) iodide

Tip - don't forget to add the unit 'g' to your answer.

## Mole Calculations involving Masses of solids

$m=$ the mass of the substance given in the question
$n=$ number of moles
$\mathrm{gfm}=$ the mass of 1 mole of the substance

Example
How many moles are present in 25 g of $\mathrm{CaCO}_{3}$ ?

$$
\frac{\mathrm{n}=\mathrm{m}}{\mathrm{gfm}}
$$

$\mathrm{n}=$ ?
$\mathrm{m}=25 \mathrm{~g}$
$\mathrm{gfm}=100 \mathrm{~g}$

100 g
$\mathrm{n}=\mathrm{m} \quad=\frac{25}{\mathrm{gfm}} \quad=0.25$ moles

1. Calculate the mass of one mole of each of the following substances:
a) Bromine, $\mathrm{Br}_{2}$
b) Zinc carbonate, $\mathrm{ZnCO}_{3}$
c) Ammonium nitrate
d) Iron (III) sulphate
e) Carbon tetrahydride
f) Butene
2. Calculate the mass of each of the following:
a) 4 moles of water
b) 3 moles of ammonia
c) 2.5 moles of ammonium carbonate
d) 4 moles of Silicon tetrachloride
3. Calculate the number of moles in each of the following:
a) 100 g of magnesium nitride
b) 90 g of ethane
c) 22 g of carbon dioxide
d) 127 g of iodine

## Mole Calculations involving Solutions - Volumes and Concentrations

$\mathrm{n}=$ number of moles
$\mathrm{c}=$ concentration in moles per litre $\mathrm{moll}^{-1}$
$\mathrm{v}=$ volume in litres

## Example

Calculate the number of moles present in $500 \mathrm{~cm}^{3}$ of NaCl of concentration $0.5 \mathrm{~mol} \mathrm{l}^{-1}$.

$$
\begin{aligned}
\mathrm{n} & =\mathrm{c} \times \mathrm{v} \\
& =0.5 \times 0.5 \\
& =0.25 \mathrm{~mol}
\end{aligned}
$$

Tip - remember to convert $\mathrm{cm}^{3}$ to litres by dividing by 1000.

1. Calculate the concentration of the following solutions in $\mathrm{mol} \mathrm{l}^{-1}$.
a) 0.25 moles of sodium hydroxide dissolved in $500 \mathrm{~cm}^{3}$ of water.
b) 6 moles of potassium bromide dissolved in 3 litres of solution.
c) 0.4 moles of sodium nitrate dissolved in $100 \mathrm{~cm}^{3}$ of solution.
2. Calculate the volume of solution that would produce each of the following:
a) $\mathrm{A} 2 \mathrm{~mol} \mathrm{l}^{-1}$ solution containing 6 mol of sulphuric acid.
b) 1 mol of hydrochloric acid in a $1 \mathrm{~mol} \mathrm{l}^{-1}$ solution.
c) 1.5 mol of nitric acid contained in a $2 \mathrm{~mol} \mathrm{l}^{-1}$ solution.
d) A $2.4 \mathrm{~mol} \mathrm{l}^{-1}$ solution containing 0.6 mol of potassium iodide.
3. Calculate the number of moles of solute present in each of the following solutions:
a) 2 litres of $1 \mathrm{~mol} \mathrm{l}^{-1}$ sodium hydroxide.
b) 0.25 litres of $3 \mathrm{~mol} \mathrm{l}^{-1}$ ammonia.
c) $250 \mathrm{~cm}^{3}$ of $2 \mathrm{~mol} \mathrm{I}^{-1}$ lithium nitrate.
d) $500 \mathrm{~cm}^{3}$ of $0.1 \mathrm{~mol} \mathrm{l}^{-1}$ potassium iodide.

Tip - remember to convert $\mathrm{cm}^{3}$ to litres by dividing by 1000.

## Mole Calculations - Combining Masses, Volume and Concentration

1. Calculate the concentration of the following solutions:
a) 222 g of calcium chloride in 4 litres of solution.
b) 20.2 g of potassium nitrate in $250 \mathrm{~cm}^{3}$ of solution.
c) 4 g of sodium hydroxide in $250 \mathrm{~cm}^{3}$ of solution.
d) 1.49 g of ammonium phosphate in $20 \mathrm{~cm}^{3}$ of solution.
2. Calculate the mass of solute present in each of the following solutions:
a) 1 litre of $1 \mathrm{moll}^{-1} \mathrm{Na}_{2} \mathrm{CO}_{3}$
b) 2.5 litres of $4 \mathrm{~mol}^{-1}$ calcium hydroxide.
c) $500 \mathrm{~cm}^{3}$ of $5 \mathrm{moll}^{-1} \mathrm{H}_{2} \mathrm{SO}_{4}$
d) $100 \mathrm{~cm}^{3}$ of $0.01 \mathrm{~mol} \mathrm{l}^{-1}$ sodium hydroxide.

## Calculations from Balanced Equations

## Example

Calculate the mass of hydrogen produced when 12 g of magnesium reacts with excess hydrochloric acid.

- First you need the balanced equation

$$
\mathrm{Mg}+2 \mathrm{HCl} \rightarrow \mathrm{MgCl}_{2}+\mathrm{H}_{2}
$$

- Now identify the substances referred to in the question - the substance you need to calculate a value for and the substance for which some numerical information is given.

$$
\mathrm{Mg}+2 \mathrm{HCl} \rightarrow \mathrm{MgCl}_{2}+\mathrm{H}_{2}
$$

- Write the mole ratio

1 mole $\mathrm{Mg} \rightarrow 1$ mole $^{\mathrm{H}}{ }_{2}$

- Calculate the number of moles of Mg in the reaction using $\frac{\mathrm{n}=\mathrm{m}}{\mathrm{gfm}} \quad=\frac{12}{24.5}=0.49 \mathrm{moles}$
- Use the mole ratio to work out the number of moles of hydrogen that will be produced

Now that you know the number of moles of $\mathrm{H}_{2}$ that would be produced you can calculate the mass using $m=n \times g f m$

$$
\begin{aligned}
& =0.49 \times 2 \\
& =0.98 \mathrm{~g}
\end{aligned}
$$

1. Calculate the mass of tin that would be produced from 7.55 g of $\mathrm{SnO}_{2}$ in the following reaction:

$$
\mathrm{SnO}_{2}+2 \mathrm{H}_{2} \rightarrow \mathrm{Sn}+2 \mathrm{H}_{2} \mathrm{O}
$$

2. Calculate the mass of iron produced from 10 g of iron (III) oxide in the following reaction:

$$
2 \mathrm{Al}+\mathrm{Fe}_{2} \mathrm{O}_{3} \rightarrow 2 \mathrm{Fe}+\mathrm{Al}_{2} \mathrm{O}_{3}
$$

3. What mass of carbon dioxide is formed when 64 g of methane burns completely in air?
4. Calculate the mass of ethanol, $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}$, needed to produce 25 moles of water during combustion of the fuel.

## Calculations based on Titrations

The results of a titration between an acid and an alkali can be used to calculate an unknown concentration of either the acid or the alkali.

## Example

The average volume of hydrochloric acid needed to neutralise 25.0 $\mathrm{cm}^{3}$ of $1 \mathrm{~mol} \mathrm{l}^{-1}$ sodium hydroxide solution is $22.4 \mathrm{~cm}^{3}$. Calculate the concentration of the acid.

- You need the balanced equation for the reaction

$$
\mathrm{HCl}+\mathrm{NaOH} \rightarrow \mathrm{NaCl}+\mathrm{H}_{2} \mathrm{O}
$$

- Now write the mole ratio

$$
1 \text { mole } \mathrm{HCl} \rightarrow 1 \text { mole } \mathrm{NaOH}
$$

- Now you need to know how many moles of sodium hydroxide you had in your reaction mixture

$$
\begin{aligned}
\mathrm{n} & =\mathrm{c} \times \mathrm{v} \\
& =1 \times 0.025 \\
& =0.025 \text { moles sodium hydroxide }
\end{aligned}
$$

- Using the mole ratio work out the number of moles of hydrochloric acid that must be present

1:1 ratio therefore 0.025 moles acid present

- Now you can calculate the concentration of the acid using $\mathrm{C}=\frac{\mathrm{n}}{\mathrm{V}} \quad \frac{=0.025}{0.0224}=1.12 \mathrm{~mol} \mathrm{l}^{-1}$

1. In a titration, $10 \mathrm{~cm}^{3}$ of sodium hydroxide solution of concentration $0.2 \mathrm{~mol} \mathrm{l}^{-1}$ was neutralised by $25 \mathrm{~cm}^{3}$ of dilute hydrochloric acid. Calculate the concentration of the acid.
2. $25 \mathrm{~cm}^{3}$ of $0.5 \mathrm{~mol} \mathrm{l}^{-1}$ potassium hydroxide solution was neutralised by $16 \mathrm{~cm}^{3}$ of nitric acid. Calculate the concentration of the acid.
$3.40 \mathrm{~cm}^{3}$ of $0.5 \mathrm{~mol} \mathrm{l}^{-1}$ lithium hydroxide solution was neutralised by $30 \mathrm{~cm}^{3}$ of sulphuric acid. Calculate the concentration of the sulphuric acid.
3. 

| Titre | Volume acid at <br> start $\left(\mathbf{c m}^{3}\right)$ | Volume acid at <br> end $\left(\mathbf{c m}^{3}\right)$ | Volume acid <br> used ( $\left.\mathbf{c m}^{3}\right)$ |
| :---: | :---: | :---: | :---: |
| Rough | 0.0 | 18.7 | 18.7 |
| $\mathbf{1}$ | 0.0 | 20.4 | 20.4 |
| $\mathbf{2}$ | 0.0 | 19.8 | 19.8 |
| $\mathbf{3}$ | 0.0 | 19.7 | 19.7 |

a. Calculate the average volume of acid needed to neutralise the alkali.
b. Why was the first titre not included when calculating the average volume?
c. Why was titre 2 not included in the calculation?
d. Why was the titration repeated?
e. $17.5 \mathrm{~cm}^{3}$ of sodium hydroxide of concentration $1 \mathrm{~mol} \mathrm{l}^{-1}$ was neutralised by hydrochloric acid during the titration. Calculate the concentration of the acid.

## Percentage Composition

Calculating the \% composition of a compound is like calculating your \% score in a test.

If you scored 18 / 20 in a test you would calculate your \% as follows:

$$
18 \times 100=90 \%
$$

$$
20
$$

In chemistry we can find the percentage by mass of an element in its compound using the same method.
First we need to know the gram formula mass of the compound (this is like the total marks for the test). Then we use the mass of the particular element in the compound in the same way as your score in the test.

## Example

Calculate the \% by mass of sodium in sodium chloride.
First use the 'Ls' to work out the gfm of NaCl .

Now we can use the mass of sodium in the gfm to work out the \% mass of sodium in the compound.

$$
\frac{23}{58.5} \times 100=39.3 \%
$$

Tip - if you are asked to calculate the '\% composition' of a compound instead of the' \% by mass' of one element in the compound, you are being asked to work out the \% of EVERY element in the compound and the total should add up to 100\%

1. Calculate the percentage by mass of hydrogen in water.
2. Calculate the percentage by mass of copper in copper (II) oxide.
3. Calculate the percentage by mass of iron in Iron (III) oxide.
4. Calculate the percentage composition of carbon dioxide.
5. Calculate the percentage composition of zinc carbonate.

## Calculating the Energy Released from Fuels

In this experiment you will probably have used a spirit burner to heat a specific volume of water using different alcohols as fuels. You will have measured the starting and final temperature of the water and the volume of water being heated.

## You need to know

- The temperature rise in ${ }^{\circ} \mathrm{C}$
- The mass of water heated in kg (remember that $1 \mathrm{~cm}^{3}$ can be taken to have a mass of 1 g )
You will also use the specific heat capacity of water, c , which you can find in the front of your National 5 data book.

A typical results table is shown below:

| Initial temperature of the water $\left({ }^{\circ} \mathrm{C}\right)$ | 23 |
| :---: | :---: |
| Final temperature of the water $\left({ }^{\circ} \mathrm{C}\right)$ | 31 |
| Volume of water heated $\left(\mathrm{cm}^{3}\right)$ | 100 |
| Mass of fuel burned $(\mathrm{g})$ | 0.2 |

You will need to use the equation

$$
E=c m \Delta T \quad \text { where }-E \text { is the energy produced }
$$

- C is the specific heat capacity of

Tip - the results table includes the mass of fuel burned but this is an attempt to confuse you. Ignore it. You will not use it in your calculation.
water

- $m$ is the mass of the water that is being heated NOT the mass of fuel burned
- $\Delta \mathrm{T}$ is the CHANGE in the water temp

## Example

Use the results in the table on the previous page to calculate the energy produced by that fuel.

The specific heat capacity of water from your data book.

1. Calculate the energy, in kJ , when 0.1 g of methanol is burned and raises the temperature of $100 \mathrm{~cm}^{3}$ of water by $11^{\circ} \mathrm{C}$.
2. Calculate the energy, in kJ , when 0.5 g of propanol heats $50 \mathrm{~cm}^{3}$ of water from $25^{\circ} \mathrm{C}$ to $43^{\circ} \mathrm{C}$.
3. The table below shows the results of an experiment in which butan-1-ol was burned and the heat transferred to $200 \mathrm{~cm}^{3}$ of water. Calculate the energy produced by the fuel.

| Initial temperature of the water $\left({ }^{\circ} \mathrm{C}\right)$ | 19 |
| :---: | :---: |
| Final temperature of the water $\left({ }^{\circ} \mathrm{C}\right)$ | 37 |
| Mass of fuel burned $(\mathrm{g})$ | 0.2 |

4. Calculate the temperature rise of $700 \mathrm{~cm}^{3}$ of water which was heated by a fuel producing 20.5 kJ of energy.
